But had such been the case, the different conditions to which they must have been subjected would in all probability have produced a variety, and ultimately resulted in the formation of a new species. A kind of beetle of the genus *Tetracha*, inhabiting tropical America, presents a most remarkable example of how individuals of a species, having accidentally strayed or been transported to a neighbouring territory, may, in a comparatively short space of time, through complete isolation and very altered conditions, be changed in form, colour, and mode of life, and thus become an entirely new species. The mode of life of this genus is identical with that of the genus *Megacephala* of the Old World, so well known to all entomologists, of which the American genus *Tetracha*, properly speaking, forms a sub-genus. *Tetracha Carolina*,...
